

INTRON precision thin film resistors are made by vacuum depositing a controlled film of NiCr on high purity prescored alumina substrate. The resistor is formed using high resolution photolithography. The patterns are designed such that no hot spots are created. The values are microtrimmed using laser to the exact value within a tolerance of 0.05%. The TCR and tolerance is obtained by process capability and does not rely on selection process. The leads are mechanically attached far from the soldering point with no chance of open circuit. The resistors are coated with electronic grade epoxy powder using fluidized bed coating machine. Resistors are printed with value, tolerance and TCR for easy identification.

## STANDARD TESTING PROCEDURE FOR 100% OF OUR RESISTORS

1. Short time Overload in which 2.5 times the rated voltage (6.25 X rated power) or maximum rated overload voltage is applied for 5 seconds
2. TCR measurement done at +25°C and +75°C
3. Ageing at rated voltage done for 0.1% and 0.05% resistors to improve stability
4. Tolerance measurement on 7½ DMM at +25°C ± 2°C
5. Visual and mechanical inspection
